

Problem Statement:

Aligned with **SDG 12: Responsible Consumption and Production**, UKM students currently lack a reliable and centralized platform to facilitate ride-sharing and the redistribution of unwanted yet still usable bulky items, especially at the end of each semester when moving back home becomes inconvenient. This leads to inefficient resource utilization, increased fuel consumption, and a higher carbon footprint.

The **EcoLoop app** addresses this issue by creating a campus-based circular economy platform that optimizes car occupancy and promotes the reuse of goods. By extending the lifecycle of resources and reducing waste, EcoLoop fosters a more sustainable, low-carbon student community.
